

COMPUTER SCIENCE PROJECT REPORT

**GYAN BHARATI (2021
SCHOOL, SAKET -2022)**

FIT FROM HOME.

BOARD ROLL NO.

**HARSH DUBEY
CLASS XIITH**

CERTIFICATE

This is to certify that
HARSH DUBEY
of class XIIth has successfully completed the project of
Computer Science, titled as
FIT FROM HOME.

for
class XII Practical Examination
Of Secondary Education for the year
2021- 2022.

It is further certified that this project is
the team work of the candidate.

SUBJECT TEACHER

CANDIDATE

Acknowledgement

I would like to express my special thanks to my school Gyan Bharati School, principal Mrs. Jyoti Saxena, to the management team of our school who gave me this golden opportunity to do this wonderful project on topic "Fit From Home" and my Computer Science teacher Ms. Neha Gaur Sharma for her able guidance and support in completing my project.

Summary

This Project revolves around bringing a gym-like experience at home and managing a gym in an online manner in the most efficient way to bring out the best results.

The online mode of the gym will be dealing with assigning the trainees with workout tasks that can be done at home according to their requirement.

On the basis of their BMI, requirements and materials available at home (such as skipping rope, cycle, dumbbells etc.) the trainees will be assigned with tasks that can be done at home. Apart from having a progress tracker (to check their durability, consistency etc.) they will also have the opportunity to consult the trainers of the gym as well.

DESCRIPTION

CALCULATOR

This module revolves around calculation of BMI (Body Mass Index), BMR (Body Metabolic Rate) and Fat percentage of the trainee. It also calculates the total calories present in a given amount of a food item. The module will be using information stored in BASIC module. The information used in the module will be used further in Progress_Tracker module.

DIET MAKER

The module combines statistical and user specific data to make a target (calorie intake) based on the user's requirement. Further the module recommends food items which can be included in the diet.

The diet which will be made for the trainee will focus on either of the three aspects; bulk, cut and maintenance.

The data from BASIC module will be used. The data stored in this module will be used further in EXERCISE module.

EXERCISE

This module will be primarily working on assigning the trainee with tasks and exercises based on their need (as stored in DIET module).

The exercises and workout sessions will be generated by the system on the basis of the data stored in the file Exercises.csv.

All workout sessions are designed to utilize all the 12 body parts such as forearms, biceps, calves, chest etc. Moreover, the workout sessions have been personalized by utilizing user-specific data such as calculation of calories burnt per minute for each exercise.

WORKOUT ASSISTANT

The workout assistant module will deal with starting a workout session with the trainee and it will be active till all the tasks have been completed in the given time slot.

The time assistant will use information from EXERCISE module and will function accordingly.

PROGRESS TRACKER

The progress tracker module will sum up all the data about the trainee such as fat percentage, change in weight etc. and keep a daily record to check the overall progress and development for the same.

The module will be using information from BASIC and EXERCISE modules.

Tools Used

Frontend: Python

Backend: File Handling

Modules used

- **random:** To generate a random workout plan for the user.
- **csv:** To store data regarding exercises and nutritional value of food items.
- **BASIC:** To input physical details of the end user.
- **CALCULATORS:** To calculate BMI, BMR, fat percentage and calories.
- **DIET:** To suggest nutritional food items and calculate consumable calories based on the goal set by the user.
- **EXERCISE:** To generate a random workout session based on the requirement of the user.
- **Workout_assistant:** To start the workout session of the user.
- **Progress_Tracker:** To show the daily progress of the user.
- **matplotlib:** To plot a graph based on the progress of the user.
- **MAIN:** To compile all the modules and start the program.

Files Used

3 CSV FILES:

-

- **Food.csv:** Used to store nutritional values(carbohydrates, proteins, fats and fibre) of various food items.
- **Exercises.csv:** To store data of various exercises and their corresponding MET values.
- **User_exercise.csv:** To store data from Exercises.csv along with user specific data(cal/min).

=====FIT FROM HOME=====
```

Welcome trainees!

Fit from home is a digital programme aiming at bringing a gym like experience at home for everyone. The programme deals with assigning trainees with workouts based on their requirement along with maintaining a diet for the same. All the data and calculations innvolved in the programme are done using highly precise formula and calculators. To make the process more engaging, the programme also offers a workout assitant and a progress tracker.

Shall we begin?

yes

Enter gender (M/F):M

Enter age (in years):18

Enter weight (in kg):75

Enter height (in cm):175

Enter height (in cm):175

Enter your choice:

- 1.Calculators

Future scope

Everyday, we are having technological advancements and in an ever changing world where people are becoming more health conscious, our project “Fit From Home” has a lot of potential in the future.

The world will only move faster and so will the lifestyle of people and in such a scenario the expectations would be to obtain maximum results in minimum time. Thus, there are chances that soon there will be workout programmes which will fulfill the requirements of the trainee faster.

Right now the program is suggesting the user food options that they can consider to either fulfill or include in their diet. But, in the future the program might be able to give the user a fully fledged diet/meal plan daily, according to their goal requirements.

In the current situation, where most of us are at our homes, there is no provision for the trainee to know whether the way he or she is performing an exercise is correct or not. This is where we believe artificial intelligence and machine learning can be integrated with fitness if not today then surely in the not so distant future.
